Modernization Without the Gamble

How HBS Systems and Monza Cloud are rebuilding a 40-year industry leader for the AI era — starting with the proof, not the promise.

AT A GLANCE

40+	1,500+	500+	POC Phase 2	1,000s of APIs
YEARS LEADING THE INDUSTRY	DEALERSHIPS ACROSS NORTH AMERICA	YEARS COMBINED EXPERTISE	PROOF OF CONCEPT, NOW BUILDING	RUN ON A FRACTION OF THE MEMORY

CLIENT	INDUSTRY	PARTNER	PLATFORM
HBS Systems	Equipment dealership management software	Monza Cloud	Nova (succeeding NetView ĒCO)

01 — THE COMPANY

For more than 40 years, HBS Systems has grown into the leading provider of Equipment Dealership Management Systems. Based in Richardson, Texas, and backed by over **500 combined years of industry experience**, HBS is trusted by more than **1,500 equipment dealerships and rental companies across North America** — many of them for the life of their business.

Its platform runs the heart of a dealership: accounting and financials, parts inventory, units, service and warranty, rental, and sales — across single stores and large multi-location dealer groups alike. For the agricultural and heavy-equipment dealers HBS serves, that software is the operational backbone of the business.

02 — THE OPPORTUNITY

A Consolidating Industry Races Toward AI

The equipment-dealership world is changing fast. Dealer groups are consolidating through steady mergers and acquisitions, while the manufacturers behind them evolve into vertically integrated technology platforms. The dealer-management-software market itself is growing at roughly 8% a year and is forecast to approach $9 billion in 2026.[1]

At the same time, AI has moved from buzzword to buying criterion. Dealers now arrive with specific use cases, and competing DMS vendors have begun launching AI-powered platforms and purpose-built AI agents.[1]

HBS saw the moment clearly: to extend four decades of leadership into the next era, its platform needed to be rebuilt on a modern foundation — one ready for the cloud and, above all, ready for AI. That is the mission behind **Nova**, the next-generation platform succeeding NetView ĒCO.

But modernization at this scale is not something to attempt alone. HBS needed a partner with the engineering depth to build Nova without putting 1,500+ dealerships at risk — and to prove it *before* betting the business on it.

> **Proof came early. Nova's hardest technical risk — some customer servers run on just 2 GB of memory — was solved in testing, running thousands of APIs on a small fraction of what the old model would demand.** (Page 4.)

03 — THE PARTNER

Experience That Knows the Customer, Meets Engineering That Knows the Future

HBS's in-house team brings something that can't be bought: decades of industry and legacy-product experience, and a deep understanding of how dealers actually work. What it needed was modern technical firepower — current application frameworks, cloud architecture, and AI — to turn that hard-won domain knowledge into a next-generation product.

Monza Cloud is a software-development consultancy offering full-service design, development, testing, staff augmentation, and ongoing support, plus managed services across the spectrum of IT. For Nova, Monza brings deep architecture and engineering expertise — including the research to find the right-fit technology for HBS's specific needs — together with the program management to run **a dozen coordinated workstreams** and mini-teams across the plan.

A blended team, built to transfer knowledge

Nova is a genuinely joint effort. The entire HBS leadership team — business, sales, marketing, engineering, network, finance, and customer-facing support — is represented in the work, so the product reflects every part of the business. Monza contributes architecture and senior engineering alongside flexible nearshore capacity. And the model is built to compound HBS's strengths: the veterans who defined the category work shoulder-to-shoulder with a new generation of HBS engineers, who level up on modern technology through the build itself — so the expertise that made HBS a leader is carried forward, not lost.

04 — EARNING TRUST

From Proof of Concept to a Committed Plan

Big modernizations fail when they start with big promises. This one started with proof. Monza and HBS began with a focused **proof-of-concept** that validated the approach against HBS's real product and constraints. Its success — followed by an extensive series of working sessions and exchanges — is what turned a promising idea into a committed, fully scoped plan.

That plan is organized into phases. **Phase 2** builds Nova's new desktop foundation across a carefully sequenced set of workstreams. **Phase 3** will follow, comprehensively modernizing every dealership module — Parts, Service, Rentals, and more — on top of that foundation.

05 — WHY MONZA

What HBS Was Really Buying

Right-fit technology, not a sales pitch. Monza led with research — evaluating frameworks and architecture against HBS's real constraints — so the stack was chosen to fit the product, not the other way around.

Program management at the core. Architecture leadership and disciplined delivery keep many parallel teams coherent — the difference between activity and progress.

Capacity that scales on demand. A blended onshore, in-house, and nearshore model lets the team run many workstreams at once and flex up or down as the plan requires.

A partnership, not a handoff. Monza builds alongside HBS and transfers knowledge as it goes, so the platform — and the team behind it — are stronger when the work is done.

The result is a partner HBS doesn't have to manage — one that brings the engineering and the discipline, proves the hard parts first, and leaves the HBS team stronger than it found them.

06 — THE PLAN

Phase 2: Building Nova's Foundation

Rather than a risky big-bang rewrite, Phase 2 establishes Nova's desktop platform through focused workstreams — each a deliberate building block, with a data-structure "deep dive" running continuously beneath them all to secure future performance and capabilities.

- 2.1 **Initial Shell** — the desktop application foundation
- 2.2 **Core / Menu** — primary navigation and structure
- 2.3 **Data-Structure Deep Dive** — performance & capability groundwork *(ongoing, all phases)*
- 2.4a **Multi-Location / Settings / Widget Management**
- 2.4b **Locking, Multi-Currency, Date/Time**
- 2.4c **Rules Engine & MFA** — logic and secure access
- 2.4d **Localization** — multi-region readiness
- 2.5 **Prototype Old & New Apps** — code-pattern standardization & benchmarking
- 2.6 **Nova Messenger** — in-platform communication
- 2.7 **Notification System**
- 2.8 **Reporting Engine**
- 2.9 **Polish & Finishing** — readiness and refinement

Then Phase 3: the whole dealership, modernized

With the foundation in place, Phase 3 carries the modernization comprehensively across every dealership module — Parts, Service, Rentals, and the rest — so that the full breadth of what dealers rely on daily moves onto Nova's modern, AI-ready architecture.

Nova is being built now. A first look at the new desktop platform is on the way as Phase 2 progresses.

07 — THE BREAKTHROUGH

An Early, Decisive Engineering Win

The clearest measure of a modernization partner isn't the process — it's the results. Nova's first big result came early, against its hardest technical risk.

That risk was hiding in the hardware. The legacy platform spans **400+ applications**, and some customer servers run with as little as **2 GB of memory**. Naively modernizing every app to run its own service could have overrun that limit — a potentially catastrophic result for live dealerships.

Monza engineered the way through. In testing, the new approach runs and supports **thousands of APIs simultaneously on a small fraction of the memory** the old model would demand — turning a project-threatening constraint into a validated path forward. It is exactly the kind of early, concrete win that proves the foundation is sound before the heavy build begins.

08 — HOW IT WORKS

The Discipline Behind the Result

Wins like that aren't luck. They come from a way of working designed to find risk early and engineer it out — across a blended in-house, Monza, and nearshore team running many workstreams at once.

Discovery before building, through continuous "deep dives"

Structured deep dives run across nearly every workstream — plus AI — so decisions are grounded in evidence, not assumption, and performance risks like the memory constraint surface *before* code is committed, not after.

Program management across many fronts

With many workstreams and mini-teams running at once, Monza provides the project management and architecture leadership that keeps parallel work coherent — standardizing code patterns, benchmarking old against new, and sequencing dependencies so the pieces fit together.

A cadence built for alignment

The teams run **two daily scrums** — one internal to Monza, one shared with HBS — plus a **weekly cadence meeting** joining the whole of HBS leadership with Monza's management and key engineers, so decisions move quickly and no workstream drifts.

WHAT THE DISCIPLINE PRODUCED

Risk found early is risk removed

2 GB
The memory ceiling on some customer servers — identified before it could threaten the build.

400+
Legacy applications mapped and accounted for in the modernization plan.

1,000s
APIs proven to run together on a small fraction of the memory the old model required.

09 — THE MOMENTUM

A Strong Start on a Long Road

Nova is still early — the work began this year and the heaviest building lies ahead. But the start has been the right kind of strong. A proof of concept earned trust. An extensive discovery turned that trust into a committed, carefully sequenced plan. A blended team of seasoned HBS insiders and Monza engineers is executing it with daily and weekly discipline. And a decisive engineering breakthrough has already removed one of the biggest risks on the path.

Just as importantly, the effort is rebuilding HBS from the inside out — modernizing not only the product but the team itself, as a new generation of engineers levels up on current technology alongside the veterans who defined the category. That is how a 40-year leader stays a leader.

10 — THE TAKEAWAY

Proof First, Risk Last

Legacy platforms don't have to be a liability, and modernizing them doesn't have to be a leap of faith. The difference shows up early: the hardest technical risk on Nova was identified and solved *before* the heavy build began. That is what "proof first" buys — confidence backed by a result, not a promise.

HBS Systems is extending four decades of leadership into the AI era — and doing it without gambling the business its customers depend on. **Monza Cloud is building it with them, blending their expertise with ours.**

Have a legacy platform ready for its next generation?

Monza Cloud blends domain expertise with modern architecture, AI, and disciplined delivery — nearshore, onshore, and in-house — to modernize mission-critical software without putting your customers at risk.
