15 Systems Were Capping Growth. Monza Built the One That Didn't.

How Monza Cloud turned a back-office bottleneck into a scalable platform for SerClean — eliminating inefficiency, enabling growth, and creating lasting value.

PLATFORM
Restoration Desk

01 — THE COMPANY

SerClean provides water extraction, mold removal, fire restoration, and disaster-recovery services to homeowners and businesses. What began in Savannah, Georgia grew into one of the Southeast's largest independently-owned restoration firms — today serving **22 areas** across the region.

Restoration isn't a scheduled business. When a storm, flood, or fire hits, SerClean mobilizes crews, trucks, and specialized equipment on short notice — often around the clock. And because most work is reimbursed through insurance claims, every job must be documented to the standard an insurer will pay against. That combination — emergency dispatch plus claim-grade proof of work — is the reality the software had to serve.

02 — THE CHALLENGE

Growth Created a Tangle of 15 Systems

Fast growth multiplies the back-office work that keeps the front office running — scheduling, inventory, IT, accounting, HR, and partner integrations. Handled well, these functions power growth. Handled badly, they quietly cap it.

SerClean started simple: email chains and single-purpose tools for communication, inventory, contracts, and invoicing. It worked — until it didn't. As job volume climbed across multiple states, the threads buckled. Too many trucks, too much equipment, too many simultaneous jobs to track by hand. **SerClean started losing money to misplaced equipment and unbilled work.**

The patch was more tools, not fewer: Dropbox, Google Sheets, and a dozen more point solutions — each reasonable alone, none talking to the others. At its peak the business ran on **roughly 15 disconnected systems**, and the in-house IT team couldn't make them act as one.

The off-the-shelf suites didn't fit either. Platforms like ServiceTitan are built around pre-booked appointments — good for plumbing, HVAC, and pool services that know their week in advance. Restoration is the opposite: emergency-driven, equipment-heavy, and billed *backwards* — paid later, through insurance claims, only once the work is proven.

> ***"We wanted to reduce our overhead, improve our profitability, and stay organized. We wanted a one-app solution built for a company exactly like ours."***
>
> **— Michael Mock, Founder, SerClean**

The cost showed up as a staffing problem. Early on, one office employee could support ten service vans; under the weight of 15 systems, SerClean needed one for roughly every **two**. The back-office software was the bottleneck — and the choice was stark: find one system to run the whole business, or stall.

03 — THE PARTNER

Choosing Monza Cloud

SerClean didn't build software. To create a platform tailored to restoration, founder Michael Mock set firm criteria for a development partner:

Long-term value — an investment that cuts overhead and travels to new locations, not another disposable tool.

Robustness — in an emergency business, downtime costs revenue and reputation.

Direct communication — a partner he could talk to and meet in person, not an offshore team.

A fit for a non-technical company — a solution for a business that doesn't run its own IT.

After talking with owners in similar industries and vetting the entire marketplace for any commercial offerings, Michael chose **Monza Cloud** — an Atlanta-based, AI and cloud-centered firm capable of building him the customization his business needed.

> **Why "Restoration Desk"?**
>
> Named deliberately, after a term the industry already knows — a statement that the category finally had software of its own. To this day there's no off-the-shelf product built for restoration the way Restoration Desk is. The platforms it's compared to — ServiceTitan, Dash — are built for other trades and ill-serve an industry where billing runs backwards through insurance claims.

04 — THE BUILD

Prove It, Deliver Relief, Then Expand

Monza doesn't just build software — we solve business problems through custom development, helping companies eliminate inefficiencies, scale operations, and create long-term value. For SerClean, that meant scoping the work in stages — learning the real pain in each function, then replacing the old tools one at a time, hardest problems first, each stage chosen to retire cost and unlock capacity rather than chase features.

1. **Prove it out**
   Prototyped and validated the approach against SerClean's real dispatch and equipment-tracking workflows — confirming the model worked before committing to a full build, and building mutual trust.

2. **First real relief**
   A cloud-hosted web and mobile app to track jobs and equipment, schedule appointments, and capture **claim-grade proof of work** — the documentation insurers require before they pay. Delivered on time at a fixed fee and scope, this was when the daily pain started to lift.

3. **Expand & deepen**
   In short, iterative sprints, Monza layered in the rest of the business — invoicing, workflow, reporting, referrals, administration, multi-tenancy, and a full CRM replacement — steadily retiring the old 15-system web.

05 — WHAT MONZA ENGINEERED

Purpose-Built to Remove Work, Not Add Features

Monza didn't hand SerClean a generic toolkit. Every capability was engineered to attack a specific business cost — lost equipment, unbilled work, manual re-entry, or the staffing creep that was capping growth. The result is a platform the restoration industry has never had off the shelf. Two capabilities show the pattern.

Boards

OUTCOME: FASTER DECISIONS, LESS REWORK

Monza built role-based "boards" so every department — management, billing, field ops, equipment — sees exactly the data it needs, live. The business impact: sharply higher day-to-day productivity and fewer things falling through the cracks.

The Job Board. One of many role-based views Monza engineered — live job, field, and billing status at a glance — so each team runs its part of the business from a single screen instead of chasing updates across tools.

Trays

OUTCOME: ZERO RE-ENTRY, INSTANT CONTEXT

Linked "tray" windows surface every facet of a job — appointments, equipment, billing, photo documentation, reports — and stay in sync with the boards. Selecting a job instantly deep-dives it, eliminating the re-navigation and duplicate data entry that used to drain staff hours.

The business impact

Before Monza, SerClean needed roughly one office worker for every two service vans — overhead that rose with every job won. By consolidating 15 disconnected tools into one engineered system, Monza broke that link between growth and headcount: SerClean later absorbed a **30% rise in job volume with no matching rise in back-office staff**. That is the difference between software that stores data and software that removes work.

Trays in action. Multiple linked windows — affected areas, demo, appointments, documents, equipment — open simultaneously for a single job, giving the user a full operational picture at once. The complete set of available Tray windows includes affected areas, appointments, chat, demo, documents, equipment, important dates, invoicing, job info, notes, payments, a PDF queue, pictures, quick details, and referral info.

Referral management

OUTCOME: MORE MEASURABLE REVENUE

Monza built a lightweight, restoration-specific CRM and payment platform around the referral network that drives SerClean's business — tracking payments, performance, and campaign results so the relationships that generate revenue are actively managed, not left to memory.

Analytics & dispatch visibility

OUTCOME: RUN THE WHOLE BUSINESS ON ONE SCREEN

Monza engineered reporting to run off a separate copy of the data, so leadership can see the company's entire current and planned operations on a single dashboard — without ever slowing the live system the field depends on.

Mobile field operations

OUTCOME: CONSISTENT WORK, FEWER ERRORS

The mobile app runs nearly all technician and vehicle work — jobs, equipment, reporting, invoicing, communications. Its standout advance is **configurable checklists** per franchise and job type that local managers can adjust on the fly, standardizing quality as staffing or legal requirements change.

06 — THE RESULTS

A Platform Proven Over Years

With the platform in place, SerClean grew weekly job volume from roughly 250 to **~325 — a 30% increase** — through years that punished the wider restoration trade, where operators named skilled-labor shortages, rising supply costs, and inflation as their top challenges and turnover ran near 28%.[1] The software didn't win the work, but it removed the back-office ceiling that would have made absorbing that growth impossible.

More scalable

The platform let SerClean absorb the full 30% rise in job volume without a matching rise in back-office staff — breaking the old pattern where every few service vans demanded another office hire.

More resilient

Cloud-hosted on Azure, Restoration Desk isn't exposed to local outages, and Monza Cloud monitors and resolves issues remotely — so SerClean stays available exactly when disaster strikes.

Leaner back office

The 15-system tangle is effectively gone — anything that survives is used in trace amounts and no longer central to running the business.

07 — THE VALIDATION

Acquired, Retained, and Built to Scale

An independent verdict on what Monza built came when SerClean was acquired by High Ground and brought into its national family of restoration brands. Software built for one company doesn't always survive that transition — much of it gets ripped out and replaced with the acquirer's standards. **Restoration Desk did the opposite: it was valued enough to be kept, invested in, and still shipping new capabilities under its new owner.**

In fact, the platform was recognized as an asset in its own right — valuable enough that High Ground acquired ownership of the software specifically, separate from the SerClean purchase. In an industry with no purpose-built alternative, a single platform that could one day run multiple brands is a tremendous asset, and the door is open to a shared advantage across the group. For a prospective client, the lesson isn't about one acquisition — it's that custom software built the right way becomes a durable, transferable business asset.

08 — THE TAKEAWAY

Monza Solves Business Problems — With Software

A tangle of disconnected tools charges a tax every day: lost data, manual rework, headcount that scales faster than revenue, and a ceiling on how big you can get. SerClean faced exactly that — and chose to build instead of settle.

What Monza delivered wasn't just an app — it was a solution to a business problem: inefficiencies eliminated, operations scaled without added overhead, and a lasting asset valuable enough to be acquired on its own. **That's the Monza difference — we solve business problems through custom development that eliminates waste, scales operations, and creates long-term value.**

What's the business problem your software should be solving?

Monza Cloud builds tailored systems that replace inefficiency with scale — turning the way *your* business actually works into a durable competitive asset.
